Forced broad claims

PRIMARY HISTORICAL CASE

Brighton Women, WSL 2023/24

All seven match-window changes were suppressed: effects were too small, unstable, or weak after multiple-comparison control. That abstention is the main credibility result.

Published corner routines

ROUTINE	N	C	S	xG
right / direct / central	45	17	17	1.91
left / direct / central	35	8	10	1.54
right / direct / near-side channel	6	3	3	0.24

C = corners producing a shot; S = total shots. Each routine links to match ID, event IDs, players, coordinates, ordered actions, and the source corner. Clusters with fewer than four examples are not published.

WHAT THE BUILD DEMONSTRATES

A complete analytical system

- Provider adapter and normalized internal event model
- Versioned metric definitions and reproducible acquisition
- Match-level bootstrap intervals and sensitivity checks
- Effect-size and false-discovery publication gates
- Deterministic reporting that works without an LLM
- Interactive evidence room and exportable reports

PORTABILITY CHECK

The same code and only a different TOML configuration processed Bayer Leverkusen: 34 matches, 236 corners, and 8 published routine groups.

POSITIONING

Historical analyst triage, not current tactical advice. No club affiliation. No private data.

No causal or predictive sporting-value claim. Raw provider data is not redistributed.
